ABSTRACT:

PURPOSE: To dry such delicate clothes as wool, knitted goods, etc., by a clothes drier of a rotary drum type by providing a rotary drum for drying clothes, a motor for driving the drum, a heater for heating air fed into the rotary drum, and a blowing fan, and executing intermittent driving of a long time stop and short time driving with respect to rotation driving of the rotary drum of the clothes drier.

CONSTITUTION: In the case of drying delicate clothes such as wool, knitted goods, etc., electric conduction is executed to a heater 13, while repeating an intermittent operation of, for instance, 'one second driving' after '10 minutes stop' with respect to a rotation of a drum 1 under the control of a control switch 14, and during that time, a blowing fan 6 rotates and continues ventilation. Accordingly, clothes are tumbled in the drum at an interval of one second in ten minutes, while being dried by blowing hot air

therefore, damage and shrinkage of clothes become extremely small.
